

FOR IMMEDIATE RELEASE

THE GREEN DINING NETWORK AND AMERECO ARIZONA
ENTER INTO AN IMPORTANT ENVIRONMENTAL ACCORD

The Green Dining Network and Amereco Arizona have signed a mutual supply agreement, initiating a direct action to significantly impact the quality of Arizona's environment. Green Dining is a pioneer in combining the services of waste cooking oil collection and related cleaning services for restaurants and food service operations. Their waste oil will now be provided to Amereco Arizona – Arizona's first and largest biodiesel producer.

Currently providing recycling service to over 1000 restaurants throughout Arizona, this association provides the Green Dining Network restaurants and their patrons the assurance that their waste oil is being recycled into products that help clean the air and reduce dependence on foreign oil. The use of waste cooking oil assures Amereco clients that the environmentally responsible biodiesel motor fuel they use is made from non-edible materials, a key factor that ensures the continuing balance to the food chain.

Green Dining President and CEO, Marvin L. McCarthy, has high expectations regarding this partnership, "We are thrilled to be working with Amereco in this effort. This is an important day in the use of waste products to reduce landfill usage, help to clean the environment and reduce our dependence on foreign oil. Our restaurant members find great value in Green Dining membership. They know they are personally contributing to a cleaner Arizona, and at the same time, are rewarded with program incentives that reduce their operating costs. It's a win for everyone."

Martin Gerst, CEO of Amereco believes that this partnership establishes an alliance that is based on principle, "The recycling concept really comes full circle when we see that, not only do we turn waste cooking oil into biodiesel, the glycerin by-product of biodiesel production is used to feed the microbes that are cleaning the water in waste-water facilities. On the restaurant side, the cleaning products produced are actually used in the restaurant to eliminate the use of toxic and flammable materials typically used in cleaning applications."
